How to Take Your Horse's Measurements

A Quick and Easy Guide

1. What You Need

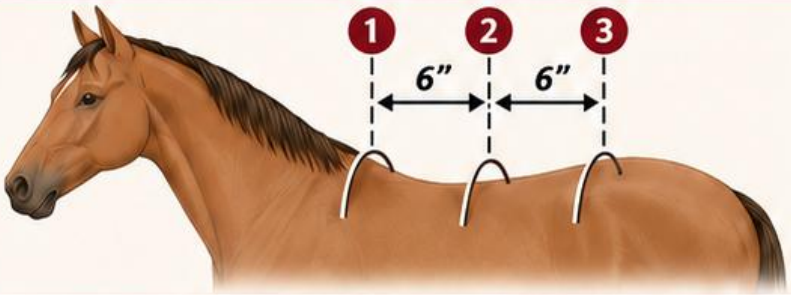
- 3 flexible wires of 16"
- 1 flexible wire of 23"
- Paper and marker
- A cellphone to take photos

Use: Romex, coaxial cable or a flexible curve ruler. Do not use metal coat hangers.

2. Before You Start

- Horse standing square and relaxed.
- The wire must lay flat against the horse.
- Do not pull tight or leave gaps.
- If your curve ruler measures 24", use only 16".

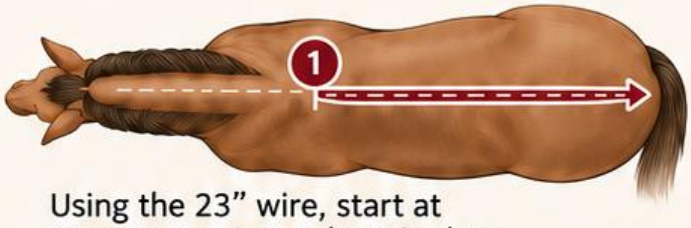
3. Take 3 Wither Measurements



1. **Measurement 1:** just behind the shoulder (at the wither).
2. **Measurement 2:** 6" behind the first.
3. **Measurement 3:** 6" behind the second.

3 measurements within a 12" span.

4. Measure the Center Line



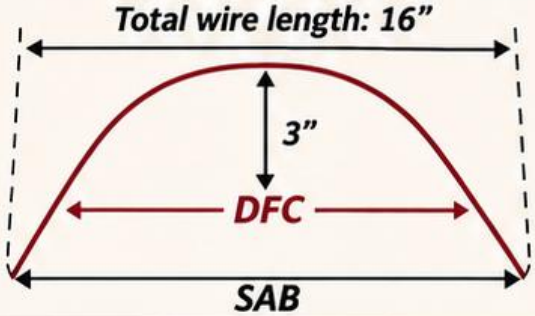
Using the 23" wire, start at Measurement 1 and run it along the horse's back to the tail.

5. Trace and Take Photos

- Remove each wire without changing its shape.
- Trace each wire on paper.
- Take a photo of each trace.
- Take photos of the horse with the wires in place.

Send us the photos and we will read the measurements.

6. 16" Wire Reference



SAB = Straight Across Bottom (base width)

DFC = 3" Down From Center

The wire should follow the horse's shape without gaps.

Important: *Send us the photos of the horse with the wires in place and the paper tracings.*
